TECHNICAL LAB OVERVIEW

Adobe Commerce as a Cloud Service

In this lab, participants will configure and deploy an end-to-end Adobe Commerce storefront by integrating Adobe Commerce as a Cloud Service (ACCS) with AEM Sites Cloud Service using Edge Delivery Services (EDS) and AEM Assets Cloud Service. Participants experience how Adobe's composable commerce architecture delivers dynamic, content-rich shopping experiences within a governed Adobe Experience Platform environment.

Configure Adobe Commerce as a Cloud Service: Set up an ACCS instance, create a store, and build a product catalog with categories and configurable products.

Connect Commerce to an AEM Sites CS / EDS storefront: Link the storefront to ACCS using GraphQL and validate that live product data is rendered on product listing and detail pages.

Integrate AEM Assets for product enrichment: Enable AEM Assets integration, synchronize approved product imagery using SKU-based matching, and enrich Commerce products with managed assets.

Validate the end-to-end experience: Access the live storefront to confirm product visibility, variant selection, and dynamic image updates in a production-style flow.

Why This Lab Matters for Marketers

Adobe Commerce as a Cloud Service | Edge Delivery Services | Adobe Experience Manager Assets Cloud Service

Director of Marketing
Decision Maker

I STRUGGLE WITH...

- Launching commerce experiences that feel cohesive when content, products, and assets live in different systems.
- Keeping product information and imagery accurate and consistent across pages, variants, and campaigns.
- Understanding how modern, composable commerce experiences are assembled and governed well enough to trust them at scale.

I WANT TO...

- Deliver storefront experiences that combine rich content with real-time product data to help customers confidently choose the right products.
- Connect website content directly to the product catalog so updates to pricing, availability, and variants are reflected instantly.
- Confidently explain how commerce experiences are powered, integrated, and governed across Adobe solutions.

I LIKE HOW ADOBE...

- Separates commerce, content, and assets while making them work together through clean integrations and APIs.
- Uses Adobe Experience Platform to provide a secure, governed foundation for data, identity, and enterprise workflows.
- Enables high-performance storefront delivery through AEM Sites and Edge Delivery Services without sacrificing flexibility or control.

Technical Lab Journey

1.5.1 Getting started with Adobe Commerce as a Cloud Service

-  Setup your CitiSignal store
-  Configure Categories and Products
-  Connect ACCS to AEM Sites CS/EDS Storefront
-  Connect ACCS to AEM Assets CS for Product Imagery
-  Validate the End-to-End Storefront Experience

Setup your CitiSignal store

In this step, participants provision and access an Adobe Commerce as a Cloud Service instance and establish the foundational commerce environment. This creates the system of record for products, pricing, and variants used throughout the lab.

Provisions an ACCS sandbox instance: Creates a cloud-hosted commerce environment for the lab.

Creates store structure and views: Defines the storefront context used by downstream integrations.

Establishes baseline configuration: Prepares Commerce to support products, pricing, and APIs.

Configure Categories and Products

In this step, participants build a realistic product catalog, including categories, configurable products, and variants. This mirrors real-world merchandising scenarios marketers manage every day.

Defines product categories: Organizes products to support browsing and discovery.

Configures configurable products: Models real purchase options like size, color, or storage.

Sets pricing and inventory: Establishes data that drives storefront behavior.

Connect ACCS to AEM Sites CS/EDS Storefront

In this step, participants connect Adobe Commerce to an AEM Sites Cloud Service storefront using Edge Delivery Services. This enables live commerce data to appear on high-performance web pages.

Connects Commerce APIs: Uses GraphQL to expose live product data.

Configures storefront settings: Defines how the site consumes commerce data.

Validates data rendering: Confirms products appear on listing and detail pages.

Connect ACCS to AEM Assets CS for Product Imagery

In this step, participants integrate AEM Assets Cloud Service with Adobe Commerce to manage and deliver approved product imagery. This ensures visual consistency and brand control.

Enables Assets integration: Activates the Commerce–Assets connection.

Matches assets by SKU: Links images to products using shared identifiers.

Synchronizes approved imagery: Delivers brand-approved visuals to the storefront.

Validate the End-to-End Storefront Experience

In this step, participants interact with the live storefront to confirm that commerce data, content, and assets work together seamlessly in a production-style flow.

Reviews product pages: Confirms listings and detail pages are populated.

Tests variants and imagery: Verifies dynamic updates based on selection.

Confirms full integration: Ensures all systems work together as expected.

Strategic & Business Value

Fast, guided setup for non-technical teams

Real-time product discovery powered by live data

Centralized brand and visual control

High-performance experiences without sacrificing governance

Clear separation of responsibilities across teams

A repeatable pattern for scalable growth
