The Evolution of AI in Customer Experience

AI Assistant Q&A

"Help me with this task"

AI retrieves, analyzes, and generates on demand.
Useful, but each action is isolated.

The limitation

Reactive, session-based. Practitioner orchestrates across tools.

AI Coworker

"Own this outcome for me"

Goal-oriented coworkers that own outcomes.
Plan, execute, validate, adjust — and learn.

The shift

Practitioners train and oversee coworkers. Goal → plan → execute

The Evolution of AI in Customer Experience

AI Assistant Q&A

You ask it, it answers

- What fields contain loyalty data?
- Estimate reach for Gold+ with yoga affinity
- Check overlap with existing audiences

...

✓ Save the audience

AI Coworker

Delegate task - "Build the audience for the yoga cross-promotion"

**REASONING → SKILL → EXECUTE →
VALIDATE → REPEAT**

- Loading audience creation skill...
- Researching data model fields...
- Checking for duplicate audiences...
- Validating data model and field paths...
- Building PQL expression...
- Running compliance check...
- Checking overlap with active journeys...
- Presenting recommendation for review...

✓ Here is the audience plan, informed by your data and existing audiences. Approve?

THE EVOLUTION

From prompts to coworkers.

The thing we engineer keeps moving outward.

2022 – 23

2024 – 25

2026 +

PROMPTS

*We engineer
the model*

CONTEXT

*We engineer
what the model sees*

RUNTIME

*We engineer
the system around the agent*

Three bridges make it business-aware.

Knowledge

semantic embeddings · MCP, A2A, APIs, CLIs · domain & operational knowledge

Tools & Protocols

Skills

SAME TECH. DIFFERENT AUTONOMY.

Augmentation

"Help me do this task"

Workflow

"Do this when X happens"

Coworker

"Own this outcome"

low autonomy

high autonomy

WHY CX ENTERPRISE DEMANDS MORE

01

Real consequences at scale.

Dev bad-commit affects one repo. Enterprise CX affects millions.

02

Multi-team trust.

Marketer → Engineer → Ops, with controlled extensibility.

03

Compounding intelligence.

A knowledge flywheel from org to team to user — under compliance.

General-purpose harnesses solve for developers. CX demands more.

AI architecture that supports CX Enterprise

TECHNICAL LAB OVERVIEW

Coworker Harness

In this lab, participants use AEP Agent Orchestrator to investigate customer data, evaluate journeys, build audiences, and orchestrate a new journey end-to-end. Coworker Harness collapses multi-tool workflows into one guided, governed conversation.

Connect to Agent Orchestrator and set context: Access the orchestrator, select the correct sandbox and data view, and confirm the agent is ready to operate on governed Adobe data.

Explore customer data conversationally: Use natural-language prompts to surface purchase trends, find schema fields, and test hypotheses about customer behavior.

Investigate journeys and audience usage: Locate journeys, inspect seed audiences, run fallout analysis, and confirm which audiences are in use today.

Create audiences and orchestrate journeys end-to-end: Build a new audience, create a multi-step journey, review conflicts, and inspect experiment performance — all in conversation.

Why This Lab Matters for Marketers

Agent Orchestrator | Real-Time CDP | Journey Optimizer | Customer Journey Analytics | AI Assistant

Director of Marketing
Decision Maker

I STRUGGLE WITH...

- Pulling cohesive customer insights when answers live across Real-Time CDP, Journey Optimizer, and Customer Journey Analytics.
- Spending too much time translating business questions into queries, audience builders, and journey configurations.
- Knowing whether my existing journeys are performing — and which audiences are still doing real work.

I WANT TO...

- Ask plain-English questions about customer behavior and get governed, accurate answers grounded in real Adobe data.
- Build audiences and journeys faster without hopping between four different UIs and remembering each one's syntax.
- Quickly diagnose journey fallout, surface conflicts, and validate experiments so I can adjust campaigns in flight.

I LIKE HOW ADOBE...

- Lets me drive Real-Time CDP, Journey Optimizer, and CJA from a single conversational interface that respects existing permissions.
- Grounds every answer in my actual sandbox data and approved schemas, not generic AI guesses.
- Turns multi-step workflows — explore, segment, build, validate — into a single guided conversation with the agent.

Champion/Influencer

Technical Lab Journey

1.1.6 Explore & Investigate

-  **Connect & set context**
-  **Explore purchase data**
-  **Investigate Fiber journeys**

1.1.6 Build & Validate

-  **Build new audiences**
-  **Build & manage the new journey**

1.1.6.1

Connect & set context

In this step, you sign in to Agent Orchestrator and select the sandbox and data view to establish the working context.

Accesses the orchestrator: Logs in and selects the correct Adobe instance and sandbox for the lab environment.

Selects the data view: Switches to the AdobeOne Unified Customer Data View.

Grants required permissions: Approves the access prompts the agent needs to run commands.

1.1.6.2

Explore purchase data

In this step, you use natural-language prompts to surface purchase trends and test a content-preference hypothesis against governed customer data.

Surfaces top-line demand: Asks for purchases by main category, then zooms into Fiber specifically.

Locates the right field: Asks the agent which field stores favourite genre.

Tests a correlation hypothesis: Pulls purchases by favourite genre to test the broadband-upgrade hypothesis.

1.1.6.3

Investigate Fiber journeys

In this step, you ask the agent to surface existing Fiber journeys, inspect audiences, and run a fallout report.

Finds relevant journeys by name: Lists all journeys, then filters for any containing “Fiber” in the title.

Inspects the seed audience: Asks which audience drove targeting for the Fiber Max Launch Promotion.

Runs fallout analysis: Generates a fall-out report to see where profiles drop out of the journey.

1.1.6.4

Build new audiences

In this step, you build a compound audience from observed correlations, then surface other audiences in use.

Creates a compound audience: Combines heavy downloaders with a sci-fi or fantasy genre preference into one audience.

Discovers existing audiences: Surfaces existing “heavy downloaders” audiences and recent size changes.

Validates audience usage: Asks the agent which of those audiences are in use by an active journey.

1.1.6.5

Build & manage journey

In this step, you orchestrate a new journey end-to-end, then use the agent to surface conflicts and review experiment performance.

Describes the journey in plain English: Provides target audience, email split, and follow-up logic in one prompt.

Surfaces conflicts: Lists conflicts and cites Experience League sources for guidance.

Reviews experiments: Inspects experiment performance and drills into dynamic suggestions.

Please open your laptops.

Strategic & Business Value

Drive AEP, AJO, and CJA from one conversation

Plain-English access to governed Adobe data

Faster journey diagnostics and fallout analysis

Build audiences without leaving the agent

Orchestrate multi-step journeys end-to-end

Surface conflicts and experiment results in flight
