TECHNICAL LAB OVERVIEW

AEM & Agents

In this lab, participants will explore and use AEM Agents within Adobe Experience Manager as a Cloud Service to discover, generate, manage, and update content using natural-language interactions. Participants experience how AI-powered agents reduce manual, click-heavy workflows, accelerate asset and page production, and operate directly within AEM Assets and Sites while maintaining enterprise governance.

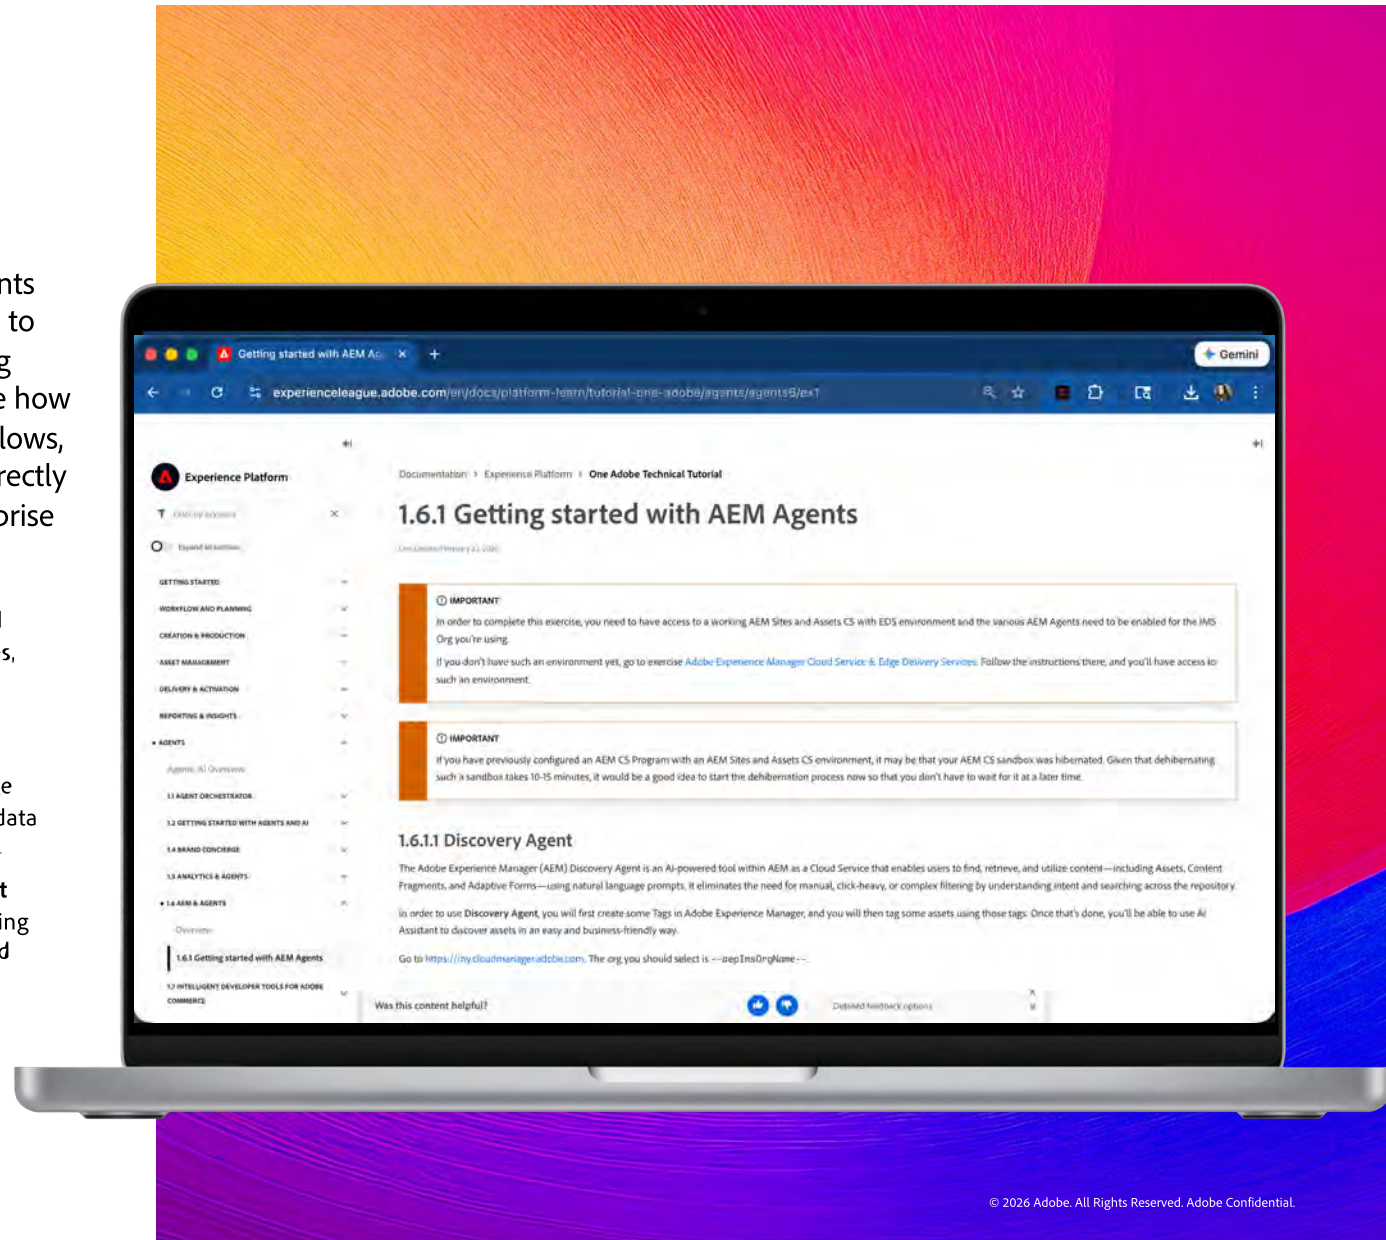

Prepare assets for AI-driven discovery: Create tag namespaces and tags, upload and organize assets, apply metadata and approval states, and prepare content so it can be discovered and acted on by AEM Agents using natural-language prompts.

Discover and generate content using AEM Agents: Use the AI Assistant to find assets based on tags and intent, generate new image renditions and social media formats, and review AI-generated metadata such as titles, descriptions, and keywords directly within AEM Assets.

Update assets and pages with Experience Production and Content Update Agents: Apply natural-language instructions to modify existing assets and web pages, including updating text, swapping images, and refining content across AEM Sites without manual editing.

Validate end-to-end execution in AEM: Review generated assets, updated pages, and promoted changes in AEM Assets and Sites, confirming approvals, launches, and published results are correctly reflected in the repository.

Why This Lab Matters for Marketers

Adobe Experience Manager Agents | AEM Assets & Sites | Adobe Experience Platform

Director of Marketing
Decision Maker

I STRUGGLE WITH...

- Finding the right assets quickly across large AEM repositories.
- Keeping content organized with consistent tagging and metadata.
- Updating pages and assets without manual, click-heavy workflows.
- Making fast content changes while staying within governance and approvals.

I WANT TO...

- Discover assets using natural-language search instead of filters and folders.
- Confidently rely on tags and metadata to power AI-driven discovery.
- Update assets and pages using simple instructions instead of manual edits.
- Validate that changes are approved, published, and stored correctly in AEM.

I LIKE HOW ADOBE...

- Uses AEM Agents to turn natural-language prompts into real content actions.
- Leverages tagging and metadata to make assets discoverable by intent.
- Lets me review, approve, and govern AI-assisted changes inside AEM.
- Keeps all assets and page updates managed in AEM Assets and Sites—no side systems.

Technical Lab Journey

1.6 Getting started with AEM Agents

-  **Prepare Assets for AI-Driven Discovery**
-  **Discover Assets Using the Discovery Agent**
-  **Review & Enrich AI-Generated Metadata**
-  **Govern Assets with Approvals & Status**
-  **Generate Channel-Ready Variations with Agents**
-  **Update Pages Using Content Update Agents**
-  **Validate, Publish & Promote Changes**

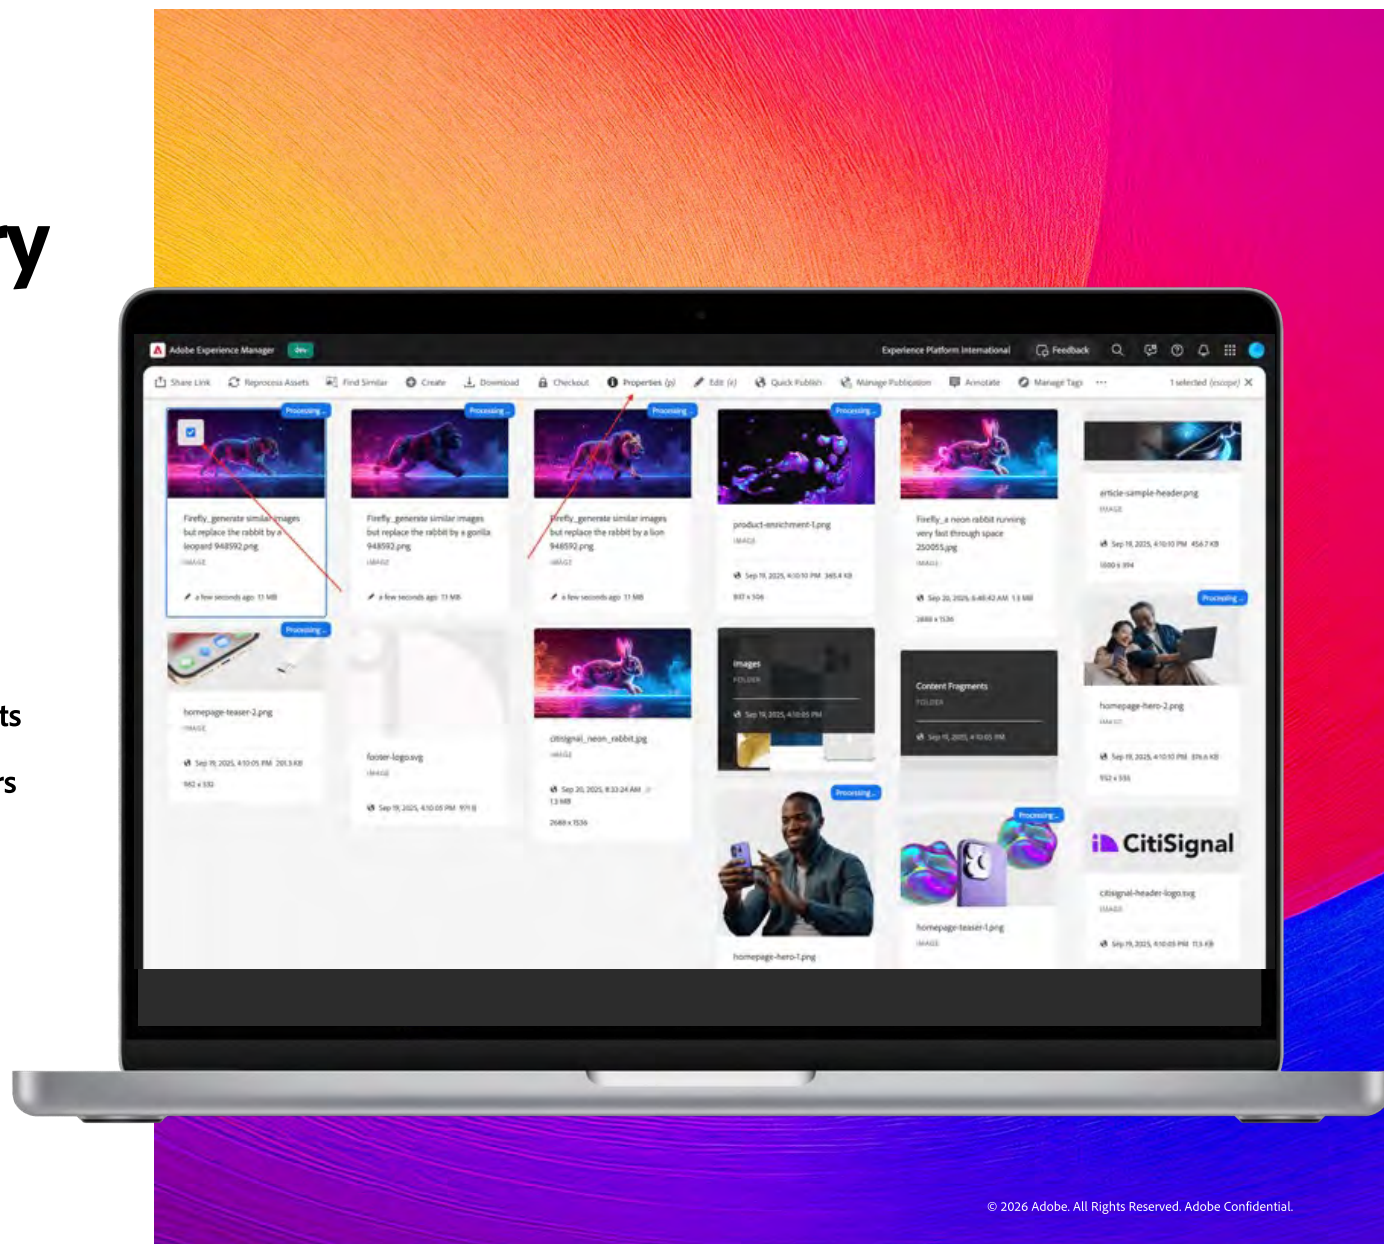

Prepare Assets for AI-Driven Discovery

In this step, participants access Adobe Experience Manager, create structured tags, and prepare assets with metadata so they're ready for AI-driven discovery by AEM Agents.

Establishes the metadata foundation for AEM Agents

Enables natural-language discovery instead of filters

Prepares assets for governed AI-assisted actions

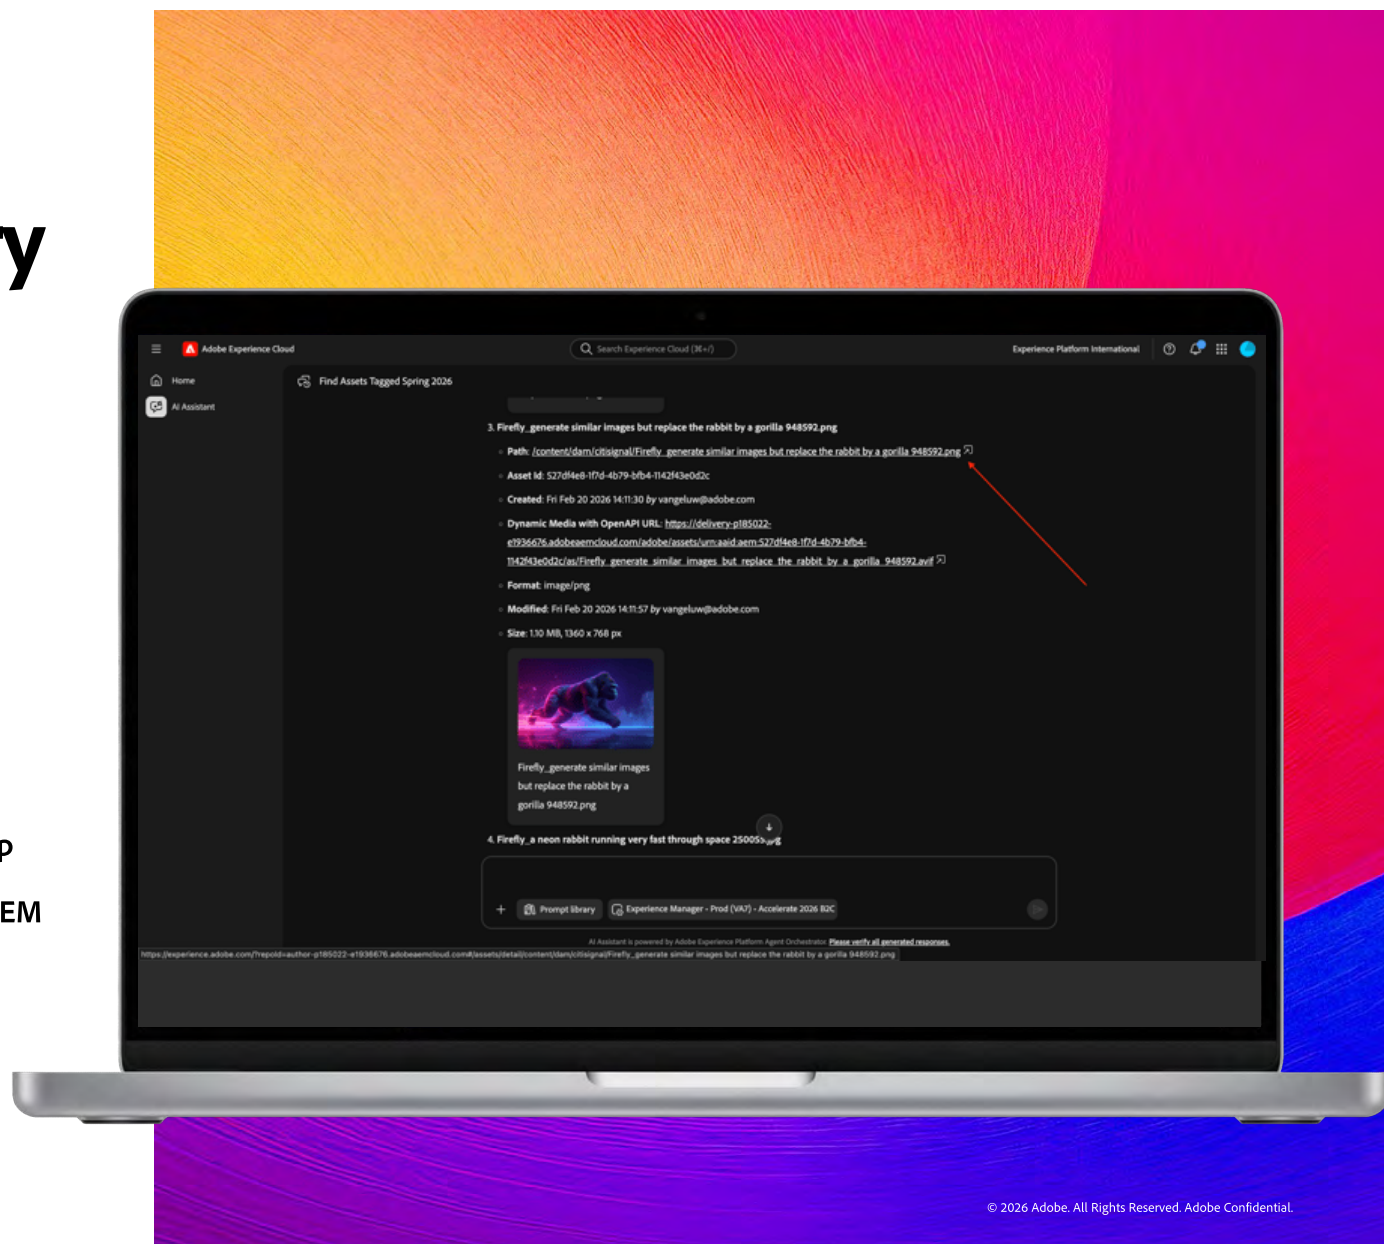

Discover Assets Using the Discovery Agent

In this step, participants use the AEM Discovery Agent through AI Assistant to find campaign assets using natural-language prompts, based on the tags and metadata created earlier.

Replaces filters and folders with intent-based discovery

Uses tags and metadata created in the previous step

Surfaces governed, approved assets directly from AEM

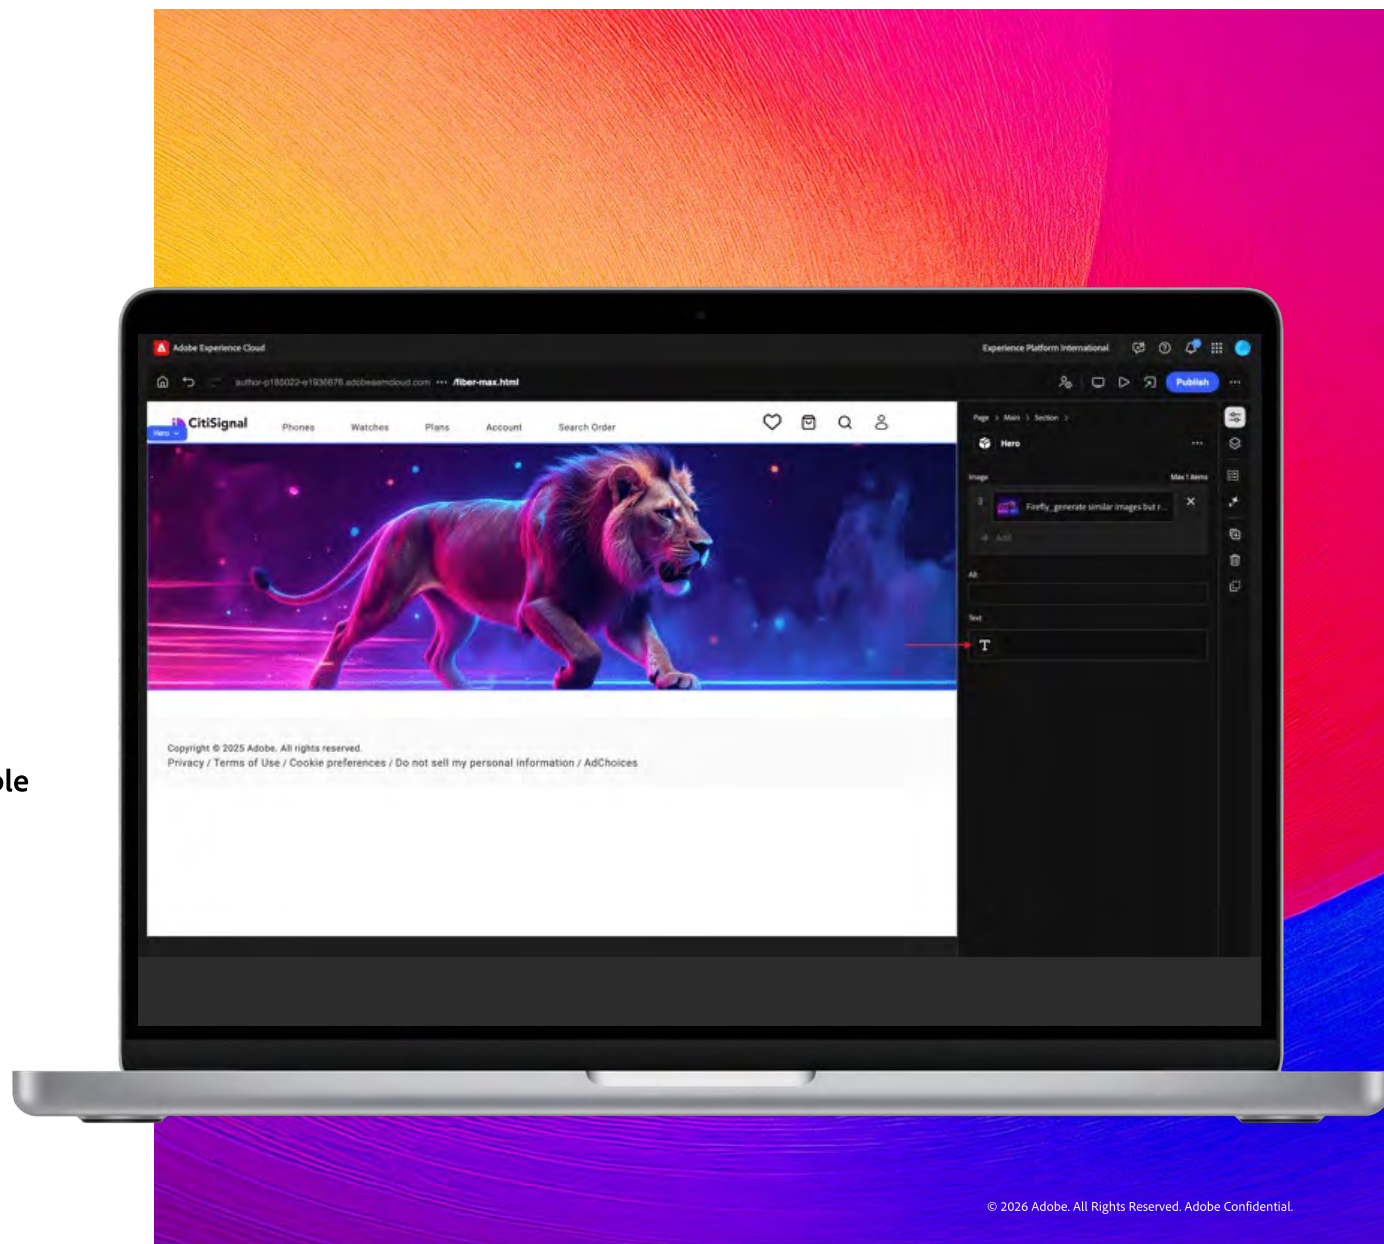

Review & Enrich AI-Generated Metadata

In this step, participants review AI-generated metadata on assets, validate titles, descriptions, and keywords, and confirm that content is accurate and ready for governed use.

Makes AI-generated metadata visible and reviewable

Combines AI enrichment with human validation

Prepares assets for approval, activation, and reuse

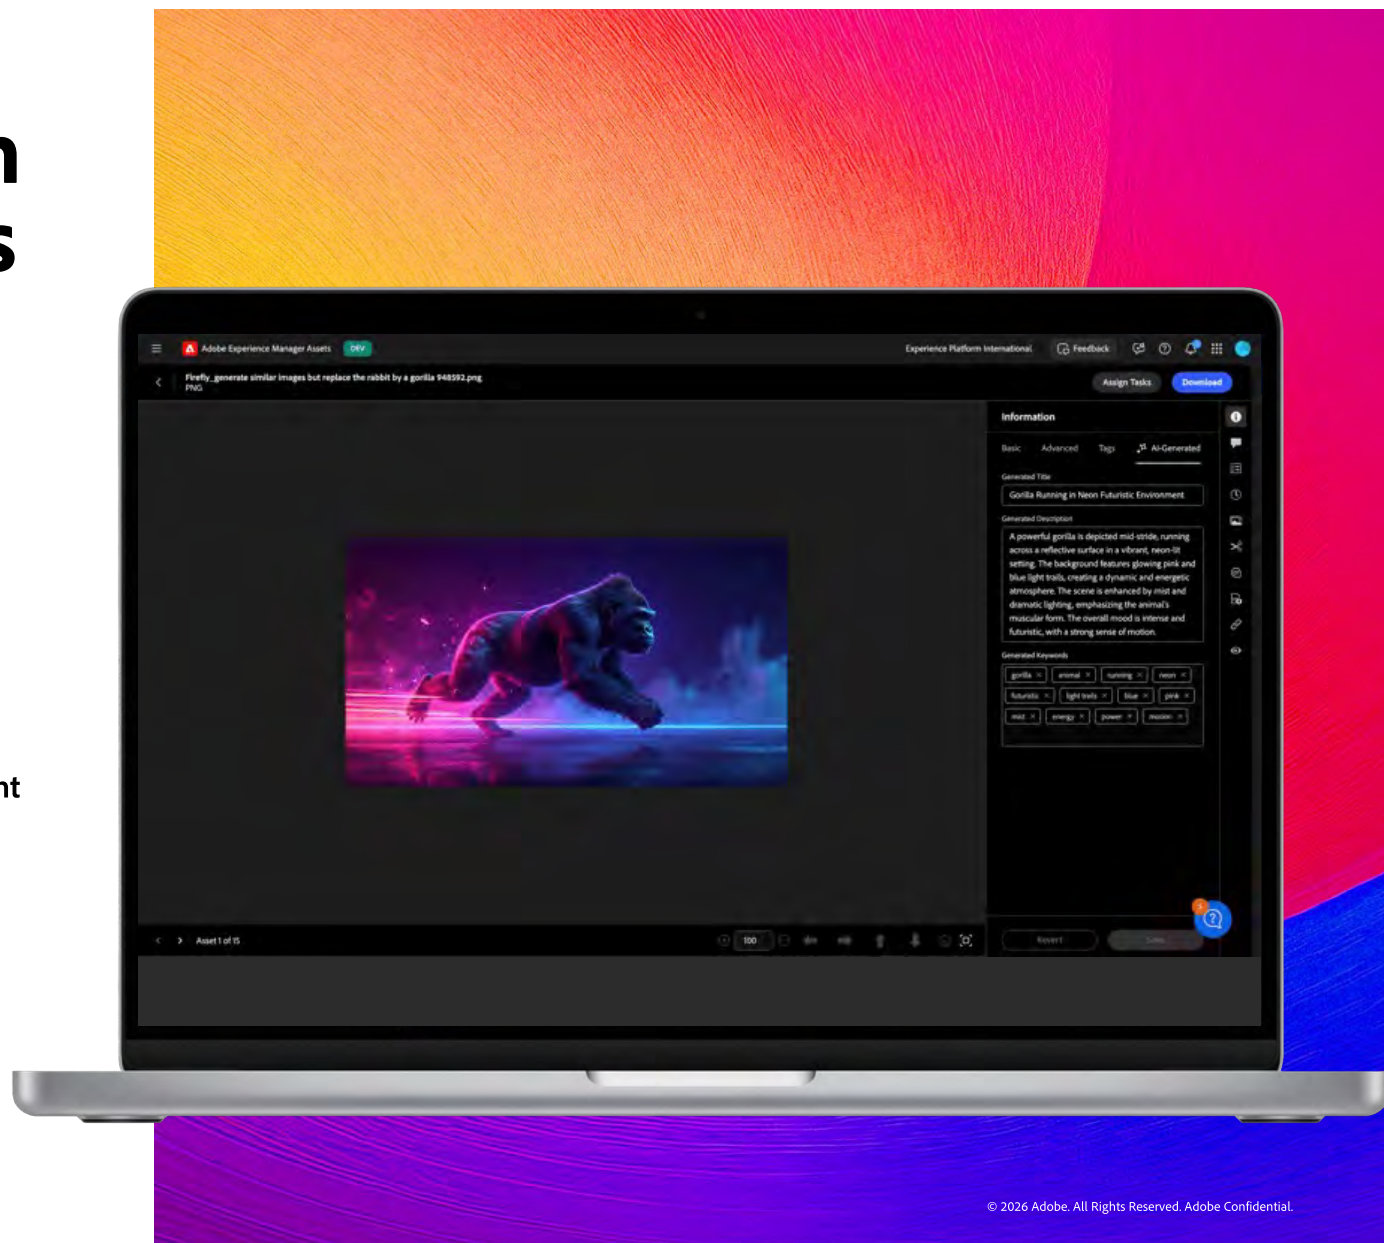

Govern Assets with Approvals & Status

In this step, participants apply approval states to assets, review governance metadata, and confirm that AI-assisted content is ready for activation and downstream use.

Applies enterprise governance to AI-assisted content

Keeps humans in control of what gets activated

Ensures only approved assets move downstream

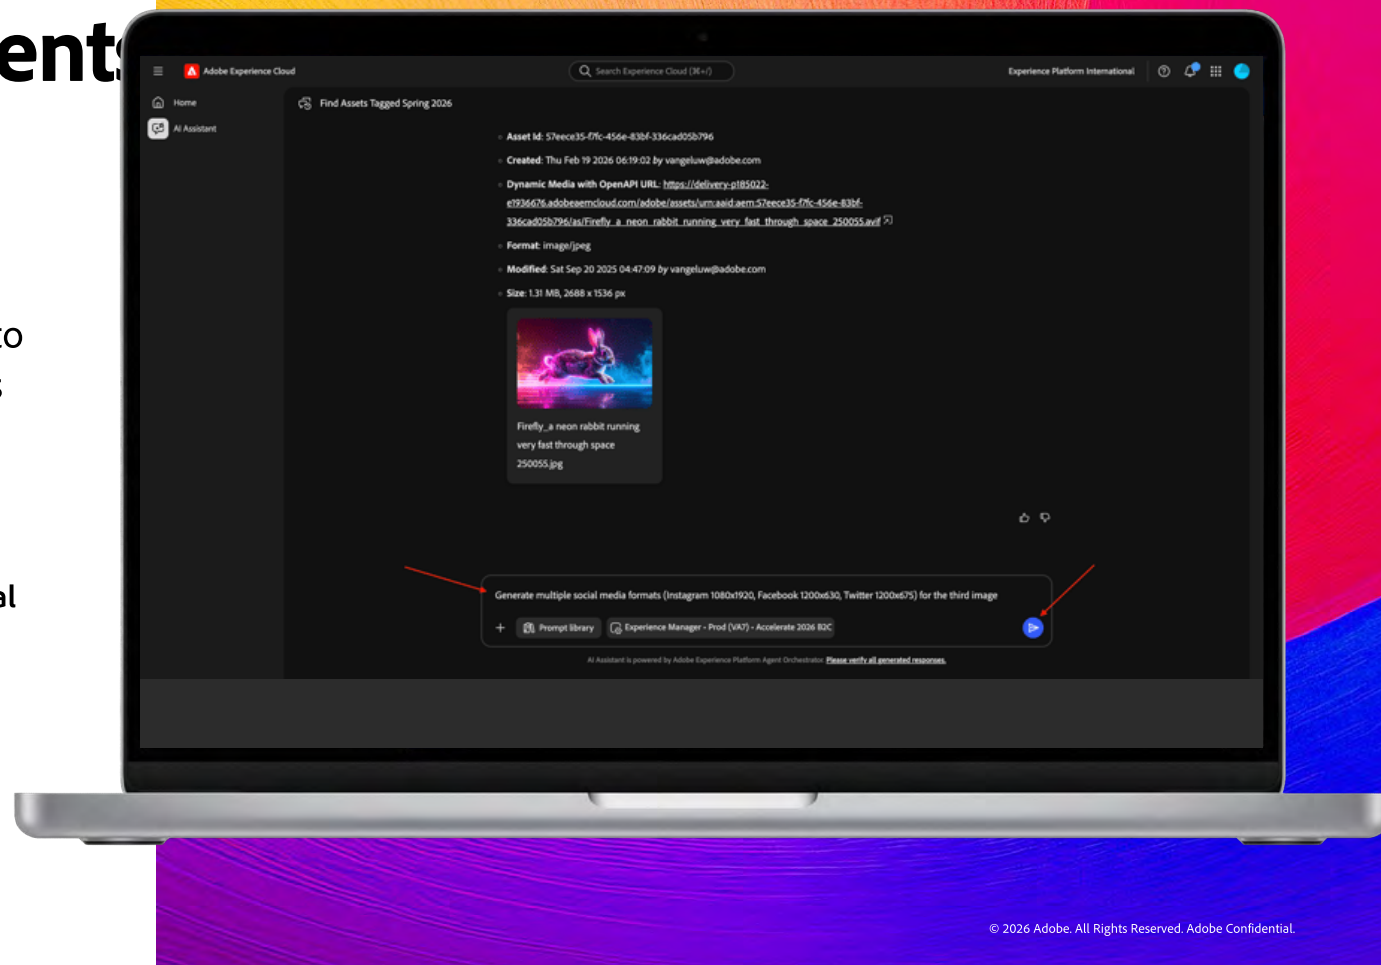

Generate Channel-Ready Variations with Agents

In this step, participants use AEM Agents to generate channel-specific asset renditions by issuing natural-language prompts that create social-ready formats directly from approved assets.

Generates channel-ready variations without manual resizing

Uses approved, governed assets as input

Keeps all outputs managed within AEM Assets

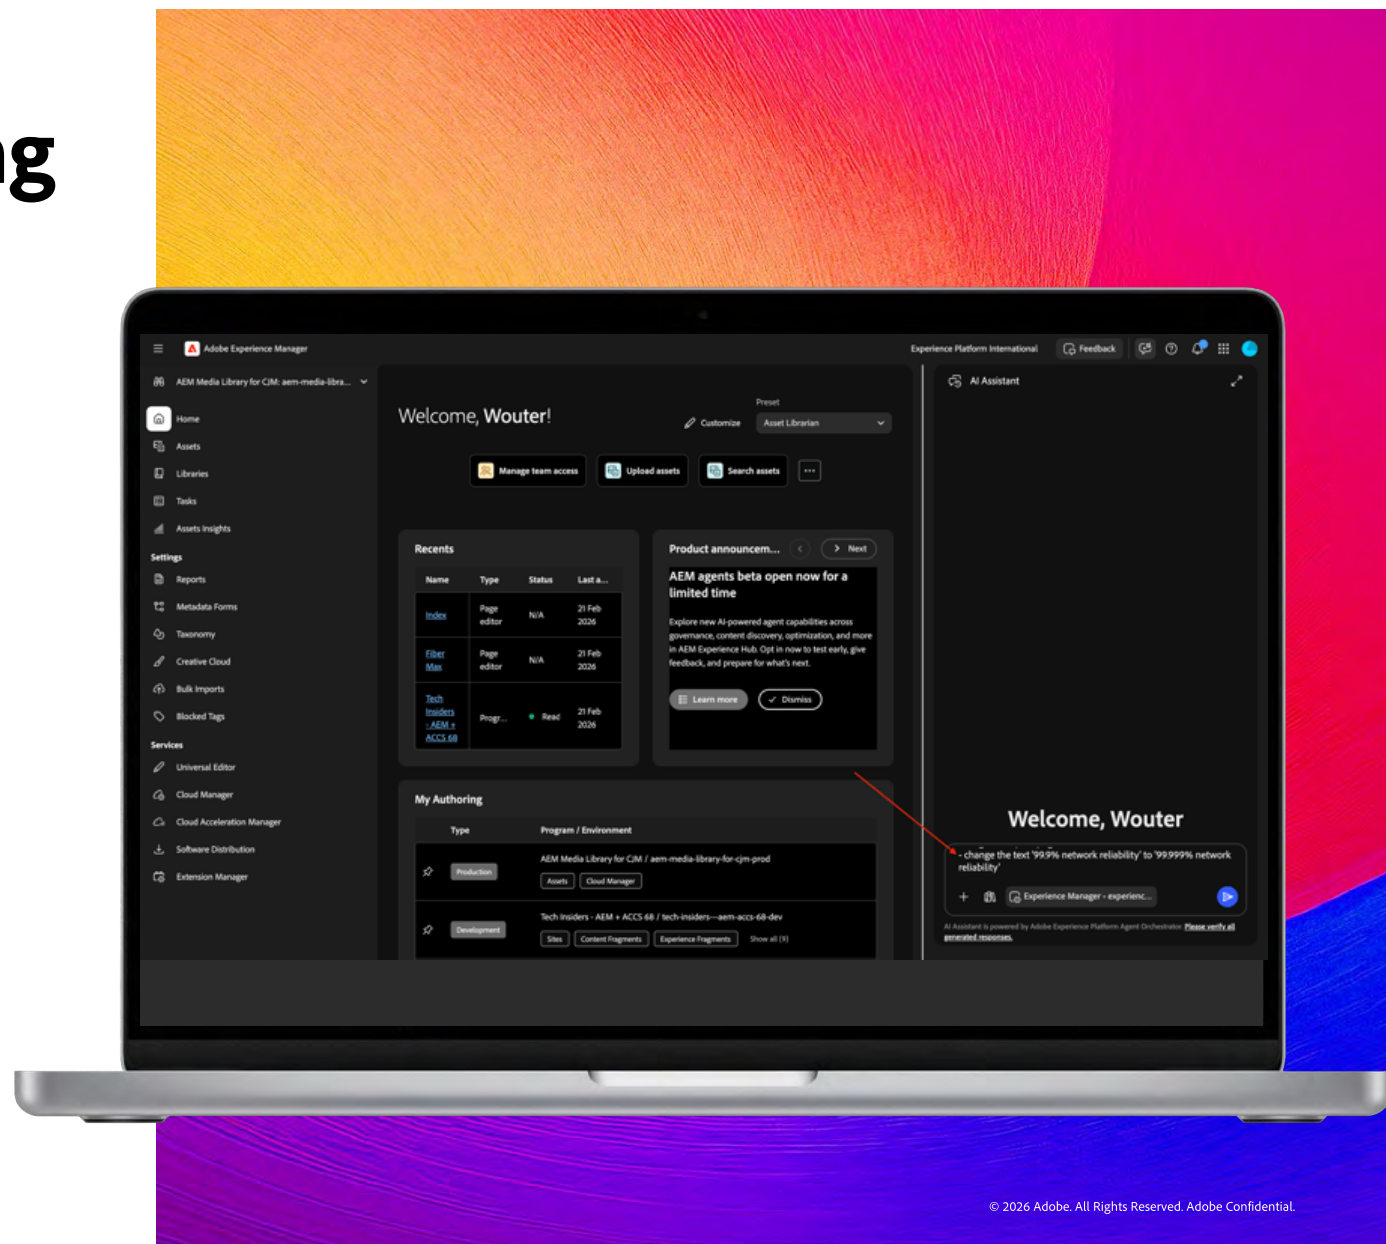

Update Pages Using Content Update Agents

In this step, participants use Content Update Agents to modify an AEM Sites page by updating images and text using natural-language instructions instead of manual editing.

Updates pages without manual authoring or code

Uses approved, governed assets as inputs

Keeps humans in control of final changes

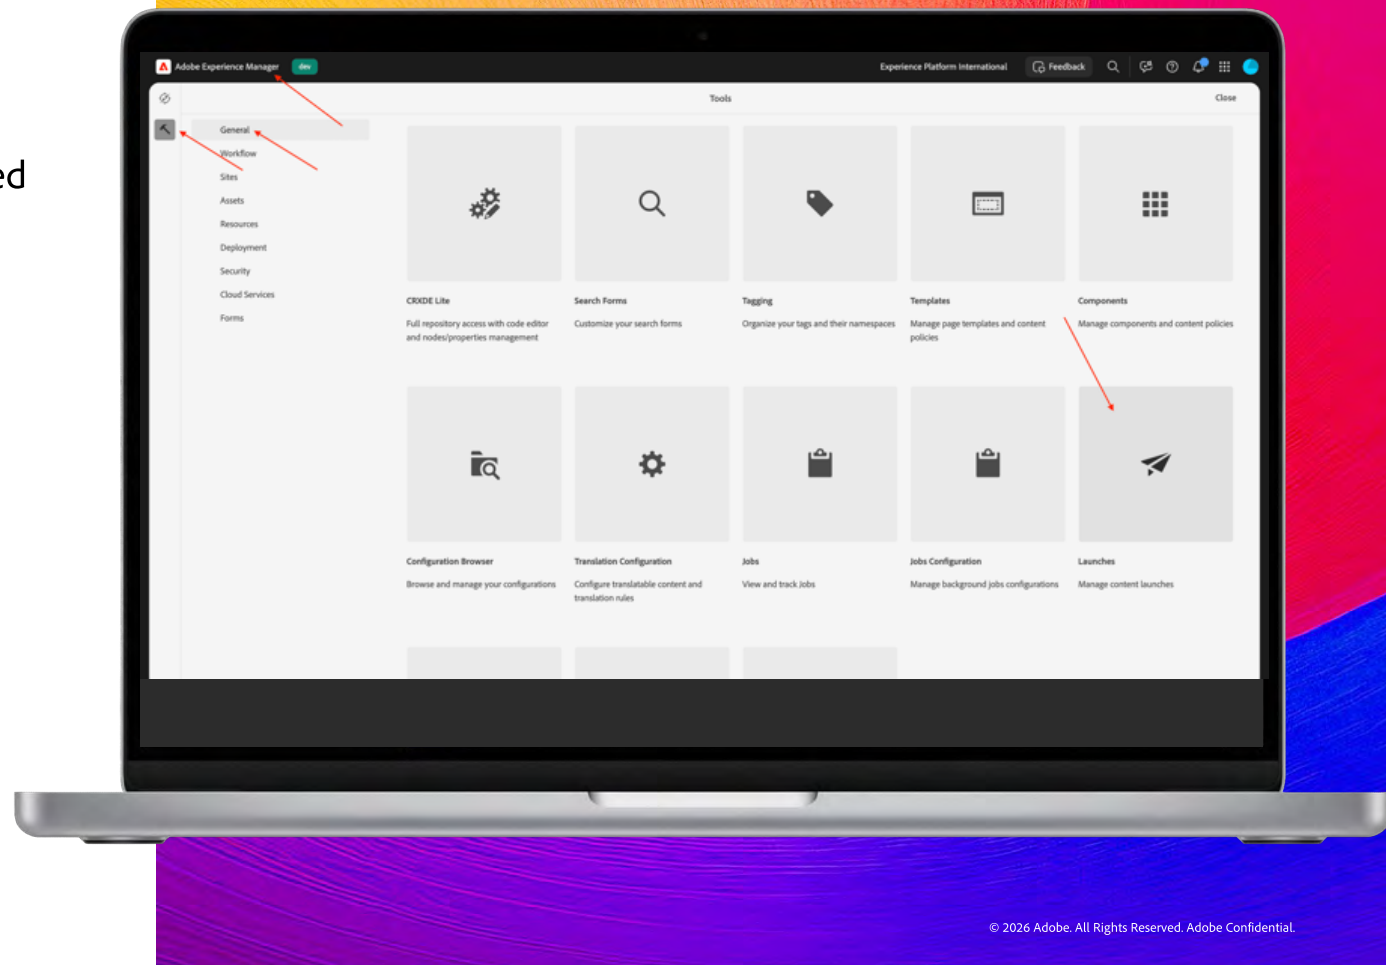

Validate, Publish & Promote Changes

In this step, participants validate AI-assisted updates, publish changes using AEM governance workflows, and promote approved updates to production.

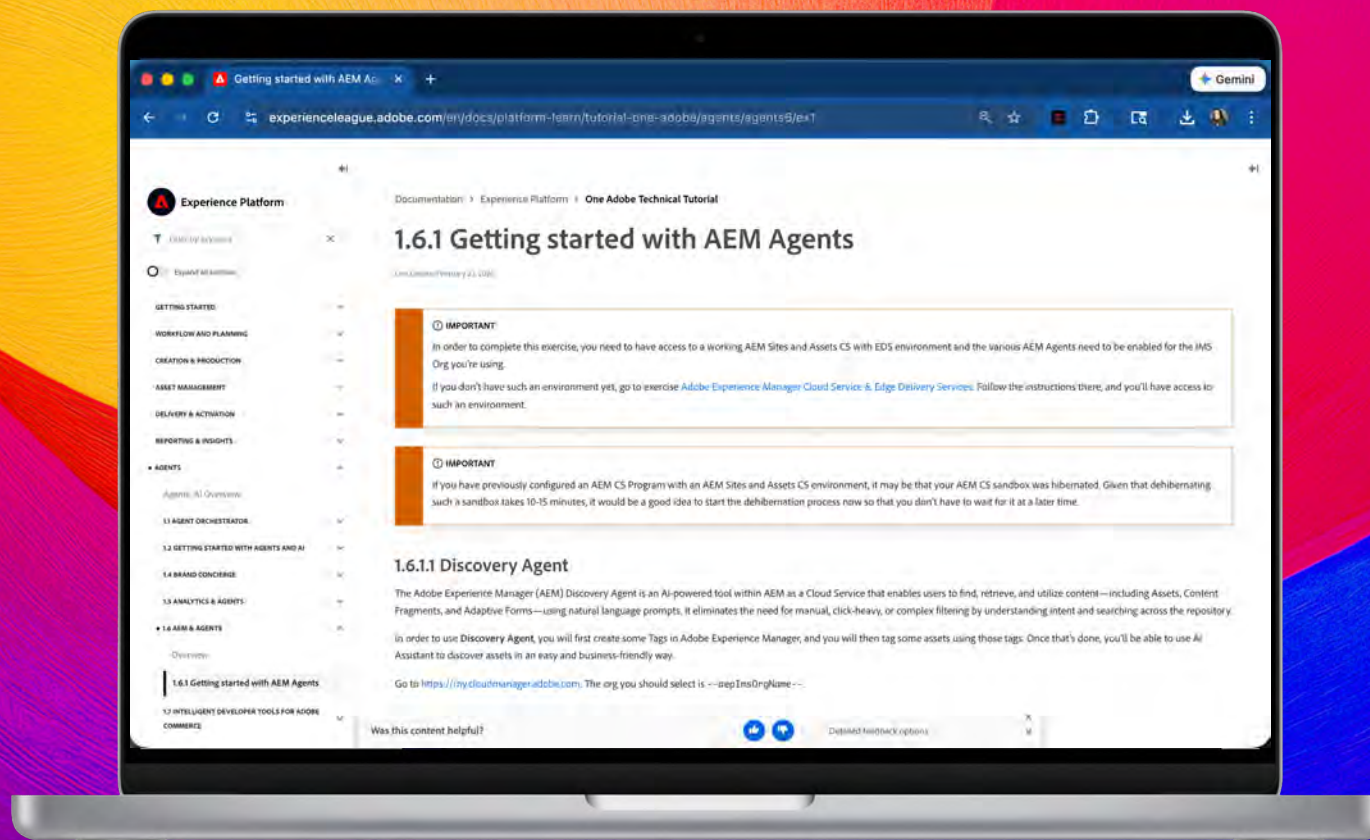

Keeps humans in control of final activation

Uses AEM Launches for safe, governed promotion

Ensures only reviewed changes reach production
