TECHNICAL LAB OVERVIEW

Adobe Marketing Agent with Microsoft 365 Copilot or ChatGPT

In this lab, participants will learn how to use Adobe Marketing Agent inside Microsoft 365 Copilot to quickly surface insights that support real marketing decisions.

Explore AMA inside Teams + Copilot/ChatGPT:
Experience how AMA loads into Teams and interacts with Copilot to deliver insights.

Use AMA to analyze marketing data: Ask natural-language questions to uncover trends, content preferences, and campaign signals.

Understand journeys & fallout for campaign planning:
Review existing journeys, identify drop-offs, and interpret fallout to guide smarter planning.

Why This Lab Matters for Marketers

Adobe Marketing Agent | Microsoft Copilot or ChatGPT | Adobe Journey Optimizer

Director of Marketing
Decision Maker

I STRUGGLE WITH...

- Understanding trends, preferences, journeys, and fallout across my campaigns.
- Quickly accessing the data I need to make decisions.
- Knowing which signals matter when planning Fiber and Broadband campaigns.

I WANT TO...

- Ground campaign decisions in real, data-driven insights.
- Uncover what customers prefer and when demand peaks.
- Confidently navigate trends, content behaviors, journeys, and fallout.

Marketing Ops
Champion/Influencer

I LIKE HOW ADOBE...

- Brings insights directly into where I already work using AMA and Copilot/ChatGPT.
- Helps me interpret demand, discover content behaviors, and explore journeys through natural-language queries.
- Mirrors real-world marketing needs so I can plan campaigns more strategically and responsively.

Technical Lab Journey

1.1.3 Adobe Marketing Agent with Microsoft 365 Copilot
or 1.1.2 Adobe Marketing Agent for ChatGPT Enterprise

-  Install Adobe Marketing Agent
-  Setting the Sandbox Context
-  Explore Purchase and Content Data
-  Review Journeys
-  Analyze Fallout

1.1.3.1

Setting Up the App in Teams via a Manifest File

In this step, you'll install AMA in Teams by uploading a manifest file, which establishes the app's identity, required permissions, and the connection points AMA uses to communicate with Copilot or ChatGPT.

Manifest defines app identity & permissions: The manifest tells Teams what the app is, what it's allowed to do, and how it connects.

AMA in beta → sideload required: Because AMA is still in beta, you upload the manifest manually rather than installing from the app store.

Enables Copilot/ChatGPT to AEP communication: Installing the manifest activates the secure connection path that lets AMA pass requests between Copilot/ChatGPT and Adobe Experience Platform.

Adobe

1.1.3.2

Setting Context in Adobe Marketing Agent

In this step, you'll set AMA's context by selecting the correct sandbox and dataview so the agent pulls data from the CitiSignal environment used throughout the lab.

Context = sandbox + dataview: Context tells AMA which environment and dataset it should query.

Default is not the CitiSignal environment: AMA initially points to a generic environment, which will return incorrect or empty results.

Must select correct sandbox: Switching to the CitiSignal sandbox ensures AMA returns data tied to the Fiber and Broadband campaigns.

1.1.3.3

Analyzing Purchase Trends & Zooming Into Fiber

In this step, you'll use AMA to analyze purchase trends across categories and then zoom into Fiber to uncover seasonal demand patterns.

Analyze category-level purchase trends: Ask AMA to visualize purchase activity across major categories over time.

Identify seasonal demand signals: AMA highlights spikes in activity that indicate timing opportunities like pre-Black Friday demand.

Zoom into Fiber performance: Drilling into Fiber reveals specific weeks where demand peaks to guide campaign planning.

Adobe

1.1.3.4

Correlating Orders with Content Preferences

In this step, you'll use AMA to discover which content preferences correlate with higher-value customers to support Broadband targeting.

Discover the right schema attribute: AMA helps identify the correct field (such as preferredGenre) without manual schema digging.

Analyze content preferences over time: Ask AMA to show which genres are most popular among high-bandwidth users.

Apply insights to campaign targeting: These signals help inform content strategy and audience segmentation for Broadband campaigns.

Adobe

1.1.3.5

Identifying Existing Fiber Journeys

In this step, you'll review existing Fiber journeys in AMA to understand their structure and identify potential gaps.

Explore current Fiber journeys: AMA surfaces journeys related to Fiber campaigns.

Detect missing or inactive audiences: Some journeys may show no audiences due to configuration or data constraints.

Interpret what the results mean: The output prompts analysis of whether journeys are inactive, misconfigured, or simplified for the lab.

1.1.3.6

Validating Journey Performance via Fallout Analysis

In this step, you'll use AMA to analyze journey fallout and identify where customers drop off before conversion.

Visualize customer drop-off points: AMA reveals where users exit the journey flow.

Receive optimization recommendations: The agent suggests improvements such as timing or message adjustments.

Move from insight to action: Deep links allow you to open the journey directly in AJO for further review or changes.
