TECHNICAL LAB OVERVIEW

Firefly Creative Production Enterprise Workflow Builder

In this lab, participants will configure and run end-to-end Adobe Firefly Custom Workflows to automate image and video production tasks using generative AI. Participants experience how Adobe's node-based workflow builder removes manual effort, accelerates production, and integrates with AEM Assets Cloud Service for enterprise storage and governance.

Build a Firefly Custom Workflow: Create a workflow that chains together nodes such as Remove Background, Crop Image, Composite Images (2D), and Generate Video to automate creative tasks.

Generate AI-powered assets at scale: Process individual and multiple images, apply prompts, and output both images and videos using Firefly generative capabilities.

Integrate with AEM Assets for enterprise delivery: Store generated images and videos directly into AEM Assets Cloud Service using the Output Images and Output Video nodes configured with your repository.

Validate the end-to-end workflow execution: Run the workflow, observe intermediate transformations, and confirm generated outputs appear in your AEM Assets folder.

Why This Lab Matters for Marketers

Adobe Firefly Custom Workflows | Adobe Experience Manager Assets Cloud Service | Adobe Experience Platform

Director of Marketing
Decision Maker

I STRUGGLE WITH...

- Scaling creative production without adding more design resources.
- Keeping image and video variations consistent across channels and campaigns.
- Managing creative output across systems and ensuring everything is stored in the correct brand repository.

I WANT TO...

- Automate repetitive creative tasks like background removal, cropping, and compositing.
- Generate on-brand images and videos with prompts rather than manual editing.
- Ensure all generated assets end up governed in AEM Assets with no manual uploads.

I LIKE HOW ADOBE...

- Uses a visual, node-based canvas so automation is easy to understand and modify.
- Lets Firefly output directly to AEM Assets, keeping storage, metadata, and governance centralized.
- Supports prompts, image inputs, compositing, and video generation all inside one streamlined workflow.

Technical Lab Journey

1.7 Firefly Creative Production Enterprise Workflow Builder

-  **Getting Started with Firefly Custom Workflows**
-  **Build a Basic Workflow: Remove Background**
-  **Enhance the Workflow: Remove Background + Crop**
-  **Add Compositing: Remove Background + Crop + Composite Image**
-  **Add Video Automation: Generate Video**
-  **Scale the Workflow: Multi-Image Input**
-  **Store Output in AEM Assets Cloud Service**

Getting Started with Firefly Custom Workflows

In this step, participants access Adobe Firefly, select the correct instance, and create a new workflow as the foundation for all automation.

Identifies and verifies the correct Adobe Firefly organization instance

Opens the Firefly Custom Workflows canvas

Creates a workflow container for subsequent nodes

Build a Basic Workflow: Remove Background

In this step, participants create a simple three-node workflow to remove an image background.

Loads an input image for processing

Applies Firefly's Remove Background AI node

Outputs a background-removed image

Enhance the Workflow: Remove Background + Crop

In this step, participants insert a Crop node to create a normalized, production-ready image.

Adds automated cropping to background-removed images

Defines aspect ratios and output sizes

Enhances workflow automation with layered transformations

Add Compositing: Remove Background + Crop + Composite Image

In this step, participants extend their workflow to include generative compositing via prompts.

Merges the processed image into a generative scene

Adds a text prompt to control the composite's look and feel

Produces a visually enriched, ready-to-use asset

Add Video Automation: Generate Video

In this step, participants expand the workflow to produce videos from the composite image and prompt.

Generates video outputs using images and prompts

Adds motion, styling, and animation via AI

Extends workflow capabilities beyond static imagery

Scale the Workflow: Multi-Image Input

In this step, participants replace the single input with multiple images to batch-generate creative outputs.

Processes multiple input images at once

Produces multiple composites and videos

Demonstrates Firefly's scalable production pipeline

Store Output in AEM Assets Cloud Service

In this step, participants configure the workflow to export images and videos directly into AEM Assets.

Sends all workflow outputs directly into an AEM Assets folder

Aligns creative automation with enterprise governance

Centralizes asset storage and metadata management
