TECHNICAL LAB OVERVIEW

Unified Review & Approval with Workfront, Frame.io & ESM

In this lab, participants will configure and run an end-to-end, unified review and approval workflow for a campaign asset using Adobe Workfront, Frame.io, and Enterprise Storage Management (ESM) within an Adobe Experience Platform environment. Participants experience how Adobe's connected work management and creative collaboration tools keep projects, assets, and approvals in sync from brief to "Approved".

Configure a Workfront project and task for creative delivery: Use the Integrated Campaign Execution blueprint to create a CitiSignal Fiber Launch project and a dedicated task to "Create layout using approved assets and copy."

Connect Workfront and Frame.io via Enterprise Storage Management: Leverage ESM so the Workfront project automatically appears as a matching folder in Frame.io, providing unified, cloud-based storage and permissions for campaign assets.

Provide reference imagery from Workfront and verify in Frame.io: Upload reference images (for example, Firefly-generated "laser beams running through space" and the CitiSignal rabbit) into Workfront Documents and confirm they're available to designers inside the corresponding Frame.io project.

Create, review, and approve the final asset: Generate a new "Timetravel now!" campaign image with Adobe Firefly and Adobe Express, upload it into Frame.io's Final Deliverables folder, collaborate via comments, and complete an approval workflow that syncs status back into Workfront.

Adobe

Why This Lab Matters for Marketers

Adobe Workfront | Frame.io | Enterprise Storage Management | Adobe Firefly Services | Adobe Express | Adobe Experience Platform

Director of Marketing
Decision Maker

I STRUGGLE WITH...

- Knowing which version of a creative asset is actually approved when feedback lives in slides, email, and chat.
- Seeing how requests, tasks, assets, comments, and approvals connect across different tools and teams.
- Trusting that only brand-approved, legally compliant assets make it into final delivery and activation.

I WANT TO...

- Have a single, visible workflow from Workfront task creation through Frame.io review to final Workfront approval status.
- Give designers one place to find reference assets and upload final deliverables, without re-creating folders and links per project.
- Confidently tell stakeholders which asset was approved, when, by whom, and where it lives — without hunting in multiple systems.

I LIKE HOW ADOBE...

- Uses Enterprise Storage Management so Workfront projects automatically appear as Frame.io folders, giving everyone the same asset structure and permissions.
- Lets marketers and PMs see Frame.io-hosted assets directly from Workfront Document Details, including the latest version and approval status.
- Connects Frame.io review decisions back into Workfront approvals, so “Approved” in Frame.io becomes “Approved” on the corresponding Workfront document.

Technical Lab Journey

1.8 Unified Review & Approval with Workfront, Frame.io and Enterprise Storage Management

-  Create the Campaign Project and Enable Unified Storage
-  Create the Creative Task & Add Reference Images in Workfront
-  Verify Reference Images and Final Deliverables Space in Frame.io
-  Create the Campaign Asset with Adobe Firefly and Adobe Express
-  Run the Unified Review & Approval Workflow

Create the Campaign Project and Enable Unified Storage

In this step, participants use a Workfront blueprint to stand up the CitiSignal Fiber Launch project and see how Enterprise Storage Management automatically creates a matching project folder in Frame.io.

Installs the Integrated Campaign Execution blueprint:
Provides a ready-made project template for multi-channel campaigns.

Creates a CitiSignal portfolio, program, and project:
Structures work as “CitiSignal Fiber Launch Winter 2026” with status set to Planning.

Verifies the project folder in Frame.io via ESM:
Confirms that a folder named after the Workfront project appears automatically in Frame.io.

Create the Creative Task and Add Reference Images in Workfront

In this step, participants create a dedicated task for the new campaign asset, describe its purpose, and attach reference imagery to guide designers.

Defines the creative task: Adds “Create layout using approved assets and copy” as a Workfront task assigned to the Designer role.

Sets timing and dependencies: Configures duration, predecessors, and dates to fit into the broader campaign schedule.

Uploads reference images: Attaches multiple Firefly-generated images and the CitiSignal rabbit as project documents.

Verify Reference Images and Final Deliverables Space in Frame.io

In this step, participants work in Frame.io to confirm that ESM has surfaced Workfront-uploaded images and to prepare a dedicated space for final assets.

Sees Workfront references in Frame.io: Validates that all uploaded reference images are visible to the team inside the Frame.io project.

Creates a “Final Deliverables” folder: Adds a dedicated folder where finished campaign assets will live.

Confirms status tracking on assets: Uses Frame.io statuses (for example, In Review, Needs Review) to prepare for the upcoming approval cycle.

Create the Campaign Asset with Adobe Firefly and Adobe Express

In this step, participants generate a new on-brand asset using generative AI and design tools, then prepare it for upload into Frame.io.

Generates artwork with Firefly: Uses the prompt “a neon rabbit running very fast through space” to create candidate images.

Brands the image in Adobe Express: Opens the chosen image in Express, applies the CitiSignal brand, logo, and the “Timetravel now!” text treatment.

Exports the final PNG: Downloads the finished image locally as timetravelnow.png.

Run the Unified Review & Approval Workflow

In this step, participants upload the finished asset to Frame.io, collect feedback, and complete a Workfront approval that is powered by Frame.io review decisions.

Uploads timetravelnow.png to Final Deliverables: Adds the asset into the prepared folder in Frame.io and sets its status to Needs Review.

Collaborates via comments and decisions: Tags reviewers, exchanges comments like “ready for your feedback on this one,” and marks the asset as Approved in Frame.io.

Completes Workfront approval: Creates an approval request on the corresponding Workfront document and verifies that Frame.io's Approved decision updates Workfront to Approved as well.

Strategic & Business Value

Unified, traceable review workflows

Single storage layer for creative work

Faster feedback loops between marketers and creators

Governed, activation-ready assets

A repeatable pattern for campaign-scale approvals
